BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

SUBCELLULAR LOCATION. Attached to the membrane by a GPI-anchor.
TISSUE SPECIFICITY: EXPRESSED IN THE CENTRAL NERVOUS SYSTEM, IN POSTMITOTIC CELLS OF SPINAL CORD, HINDERAIN, MIDBRAIN AND FOREBAIN. EXPRESSED IN POTHILLULAR THE DEVELOPMENT OF NON-MEDICAL TISSUES. EXPRESSED IN POTH DEVELOPMENT, SPECIFICALLY IN PREDAY. AS WELL AS IN THE DEVELOPMENT, SPECIFICALLY IN PRIMATAL BADILLA, AS WELL AS IN THE DEVELOPING EYE AND HAIR FOLLICLE.
DEVELOPMENTAL STAGE: DETECTED IN PRIMITYE ECTODERM, MESODERM AND VENTRAL ENDODERM; DOMN-REGULATED WHEN ORGANGGENESSIE IS COMPLETED.
PIN: EXTENSIVELY O-GLYCOSYLATED (HS SIMILARITY). THE CARBOHYDRATE STRUCTURE MAY BE REGULATED IN A TISSUE SPECIFIC AND DEVELOPMENTAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;

-!- TISSUE SPECIFICITY: EXPRESSED IN A VARIETY OF TISSUES.
-!- MISCELLANEOUS: THERE ARE AT LEAST SEVEN DIFFERENT GAMMA SUBUNITS WITH POSSIBLE TISSUE-SPECIFIC DISTRIBUTION.
-!- SIMILARITY: BELONGS TO THE G PROTEIN GAMMA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 REPTOG. DEV. 44:315-323(1996).
PUNCTION: GUANTINE NUCLEOTIDE-BINNING PROTEINS (G PROTEINS) ARE INVOLVED AS A MODULATOR OR TRANSDUCER IN VARIOUS TRANSMEMBRANE SIGNALING SYSTEMS. THE BETA AND GAMMA CHAINS ARE REQUIRED FOR THE GTPASE ACTIVITY, FOR REPLACEMENT OF GDP BY GTP, AND FOR G PROTEIN-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SPECIES-Mouse; STRAIN-CF-1 / Harlan; Marbins-27011591; PubMed-8858601; Williams C-3., Schultz R.M., Kopf G.S.; Marliams C-3., Schultz R.M., Kopf G.S.; "G protein gene expression during mouse oocyte growth and maturation, and preimplantation embryo development."; Mol. -!- FUNCTION: MAY PLAY A PROTECTIVE ROLE AGAINST OXIDATIVE STRESS.
-!- SUBCELLULAR LOCATION: Mitochondrial.
-!- INDUCTION: BY HEAT SHOCK, AND UNDER OTHER CONDITIONS OF STRESS, SUCH AS INCREASED SALT CONCENTRATION AND STRAYATION.
-!- SIMILARITY: BELONGS TO THE SMALL HEAT SHOCK PROTEIN (HSP20)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15-JUL-1998 (Rel. 36, Created)
